Manual testing plan for Login page
Login page:

1. When the user enters the website, it should look like the picture below

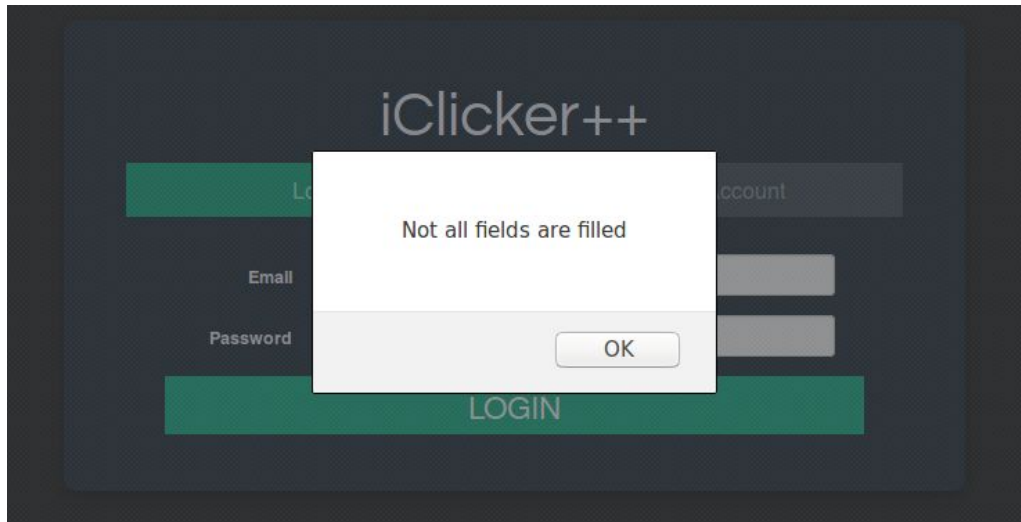

2. When the user clicks on the "Create Account" button, the page should change display to the create account form

Form authentication:

1. Try different permutations where there exists an empty input field for both the "Login" and the "Create Account" forms. The result should be an alarm that says "Not all fields are filled" as shown below

2. On the "Create Account" form, if the email is not valid, then the website should alert the user with the message "Invalid email field"
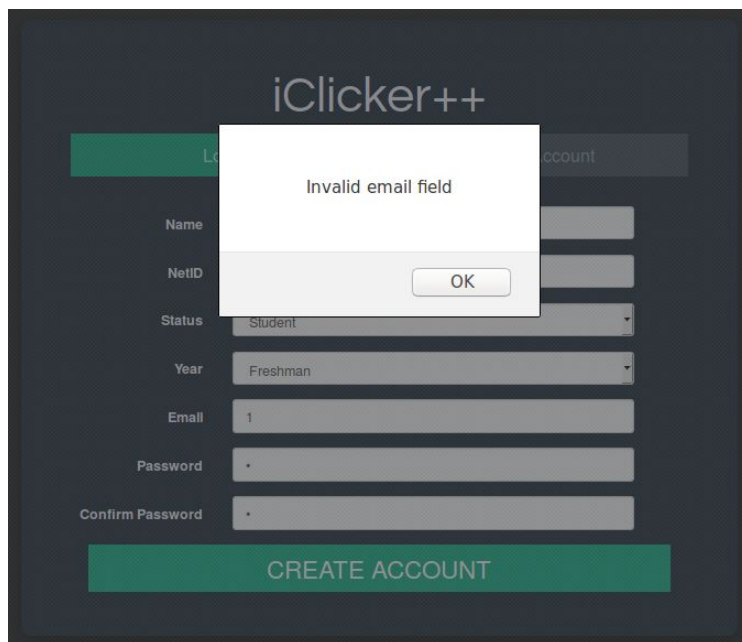

3. On the "Create Account" form, if the passwords do not match, then the website should alert the user with the message "Passwords do not match!"
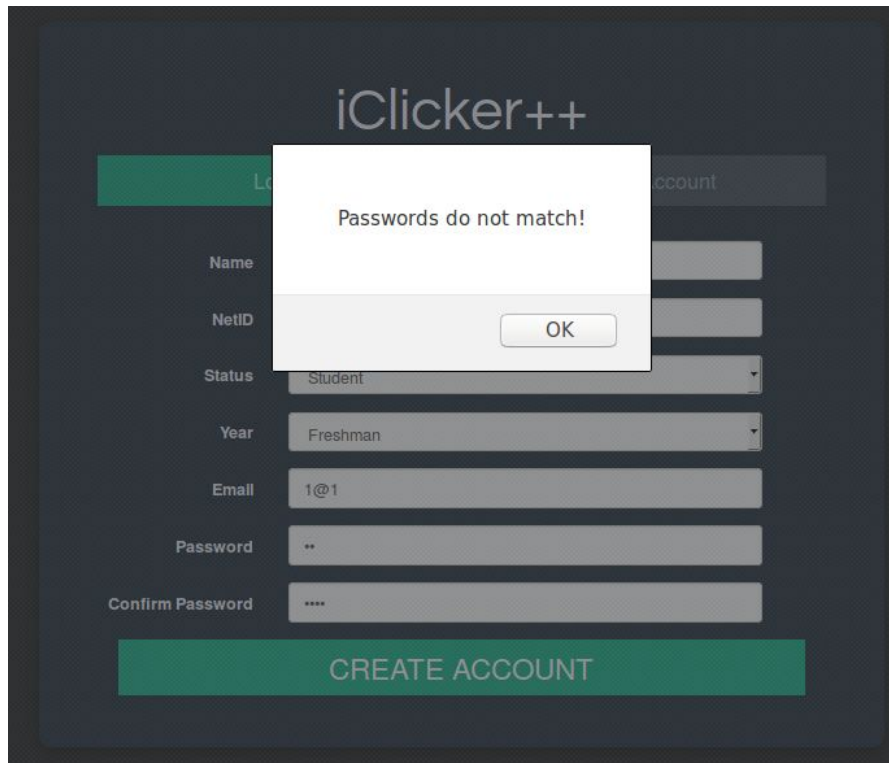

User Authentication:

1. If the server crashes or the user's email and password authentication fails, the website should alert the user with the message "Unable to login"

2. After creating an account, the user authentication should successfully sign-in the user. For temporary measures, the website will say "success"

Miscellaneous:

1. On the "Create Account" form, if the user changes the status form to "Teacher", then the year dropdown menu should disappear because the teacher does not have a year.
